

Course over-view

Software is normally developed to solve a problem. Software engineering follows an engineering discipline to convert requirements, stemming from a problem, to software. Steps that are tested and tried are followed to produce professional software along with its documentation.

Course Objectives

Software engineering is a course that is meant to teach students how to formulate software from requirements. By the end of the course, students should be able to generate requirements, analyse them, and come up with software to satisfy the requirements. All this is done by following some set rules known as an engineering discipline.

Contents

1. Introduction
2. Software Process
3. Agile Software Development
4. Requirements Engineering
5. System Modelling
6. Architectural Design
7. Design and Implementation
8. Software testing
9. Software Evolution
